

Gas ultrasonic flowmeter for permanent installation

Transmitter for permanent outdoor wall or pipe mounting

Features

- Exact and highly reliable bidirectional clamp-on flow measurement of operational and standard volume flow rates as well as mass flow rates
- High measurement accuracy even at very low as well as very high flow rates and independent of the flow direction (bidirectional)
- The measurement is zero point stable, drift free and independent of the pipe material as well as the process pressure (> 3 bar on steel pipes; no minimum pressure for plastic pipes) and the process fluid
- The measurement system also precisely measures wet gas flow rates up to 5 % LVF (liquid volume fraction)
- Advanced self-diagnosis and possibilities for event-based triggering of data recording for the supervision and control of critical processes
- G722 with advanced functionality:
 - Synchronized channel averaging to reduce turbulence-related fluctuations of the measured value
 - Multifunctional digital outputs
- Bidirectional communication and support of common bus technologies (Profibus PA, Foundation Fieldbus, HART, Modbus, BACnet, M-Bus)
- Installation and start-up do not require any pipe work nor any process interruptions
- Transmitter and transducers are separately calibrated (traceable to national standards)
- Automatic loading of calibration data and transducer recognition
- Transducers available for a wide range of inner pipe diameters and fluid temperatures
- Transmitter and transducers for use in hazardous areas are available

Applications

- Chemical industry
- Petrochemical industry
- Oil and gas industry
- Manufacturing industries

Function

Measurement principle

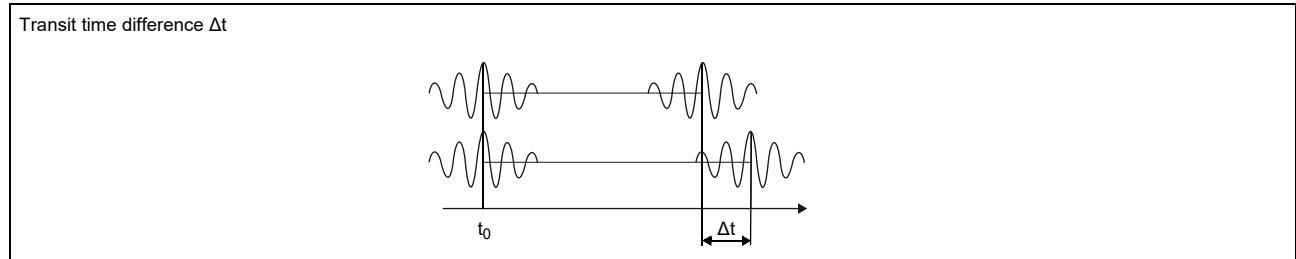

The transducers are mounted on the pipe which is completely filled with the fluid. The ultrasonic signals are emitted alternately by a transducer and received by the other. The physical quantities are determined from the transit times of the ultrasonic signals.

As the fluid where the ultrasound propagates is flowing, the transit time of the ultrasonic signal in flow direction is shorter than the one against the flow direction.

The transit time difference Δt is measured and allows the flowmeter to determine the average flow velocity along the propagation path of the ultrasonic signals. A flow profile correction is then performed in order to obtain the area averaged flow velocity, which is proportional to the volumetric flow rate.

The integrated microprocessors control the entire measuring cycle. The received ultrasonic signals are checked for measurement usability and evaluated for their reliability. Noise signals are eliminated.

Calculation of volumetric flow rate

$$\dot{V} = k_{Re} \cdot A \cdot k_a \cdot \frac{\Delta t}{2 \cdot t_y}$$

where

- \dot{V} - volumetric flow rate
- k_{Re} - fluid mechanics calibration factor
- A - cross-sectional pipe area
- k_a - acoustical calibration factor
- Δt - transit time difference
- t_y - average of transit times in the fluid

Calculation of mass flow rate

The mass flow rate is calculated from the operating density and the volumetric flow rate:

$$\dot{m} = \rho \cdot \dot{V}$$

The operating density of the fluid is calculated as the function of pressure and temperature of the fluid:

$$\rho = f(p, T)$$

where

ρ - operating density

p - fluid pressure

T - fluid temperature

\dot{m} - mass flow rate

\dot{V} - volumetric flow rate

Calculation of standard volumetric flow rate

The standard volumetric flow rate can be selected as physical quantity. It is calculated with the following formula:

$$\dot{V}_N = \dot{V} \cdot \frac{p}{p_N} \cdot \frac{T_N}{T} \cdot \frac{1}{K}$$

where

\dot{V}_N - standard volumetric flow rate

\dot{V} - operating volumetric flow rate

p_N - standard pressure (absolute value)

p - operating pressure (absolute value)

T_N - standard temperature in K

T - operating temperature in K

K compressibility coefficient of gas: ratio of the compressibility factors of the gas at operating conditions and at standard conditions Z/Z_N

The operational pressure p and the operational temperature T of the fluid will be entered directly as fixed values into the transmitter.

or:

If inputs are installed (optional), pressure and temperature can be measured by the customer and fed in the transmitter.

Calculation of gas energy flow rate (NGE)

For natural gas with changing composition (NGE fluid data sets), the Natural Gas Engine (NGE) can be used to calculate the gas energy flow rate:

$$\Phi = HHV_V \cdot \dot{V}_N = HHV_m \cdot \dot{m}$$

$$HHV_m = \rho_N \cdot HHV_V$$

where

Φ - gas energy flow rate

\dot{V}_N - standard volumetric flow rate

\dot{m} - mass flow rate

HHV_V - higher heating value, volume-related

HHV_m - higher heating value, mass-related

ρ_N - normalised density

Number of sound paths

The number of sound paths is the number of transits of the ultrasonic signal through the fluid in the pipe. Depending on the number of sound paths, the following methods of installation exist:

- **reflection arrangement**

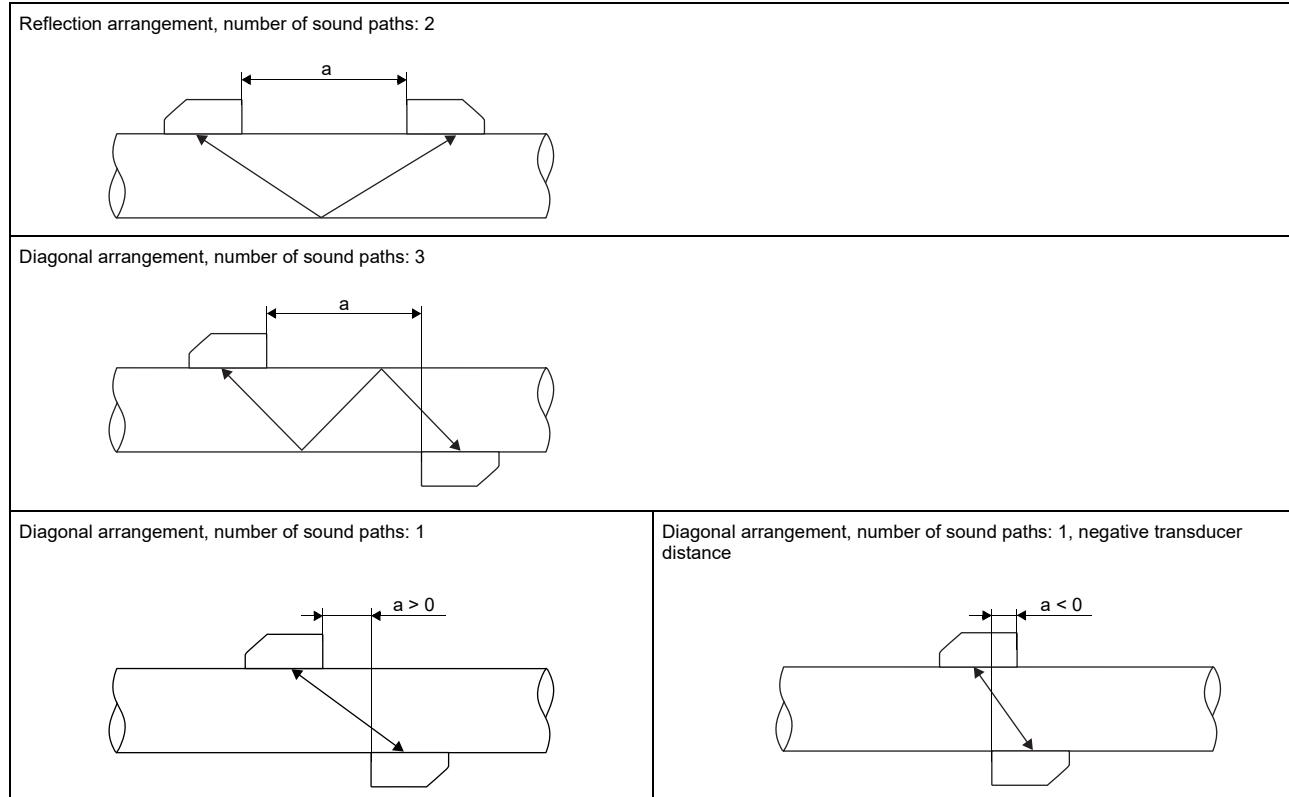

The number of sound paths is even. The transducers are mounted on the same side of the pipe. Correct positioning of the transducers is easy.

- **diagonal arrangement**

The number of sound paths is odd. The transducers are mounted on opposite sides of the pipe. In the case of a high signal attenuation by the fluid, pipe and coatings, diagonal arrangement with 1 sound path will be used.

The preferred method of installation depends on the application. While increasing the number of sound paths increases the accuracy of the measurement, signal attenuation increases as well. The optimum number of sound paths for the parameters of the application will be determined automatically by the transmitter.

As the transducers can be mounted with the transducer mounting fixture in reflection arrangement or diagonal arrangement, the number of sound paths can be adjusted optimally for the application.

a - transducer distance

Transducers

Transducer selection

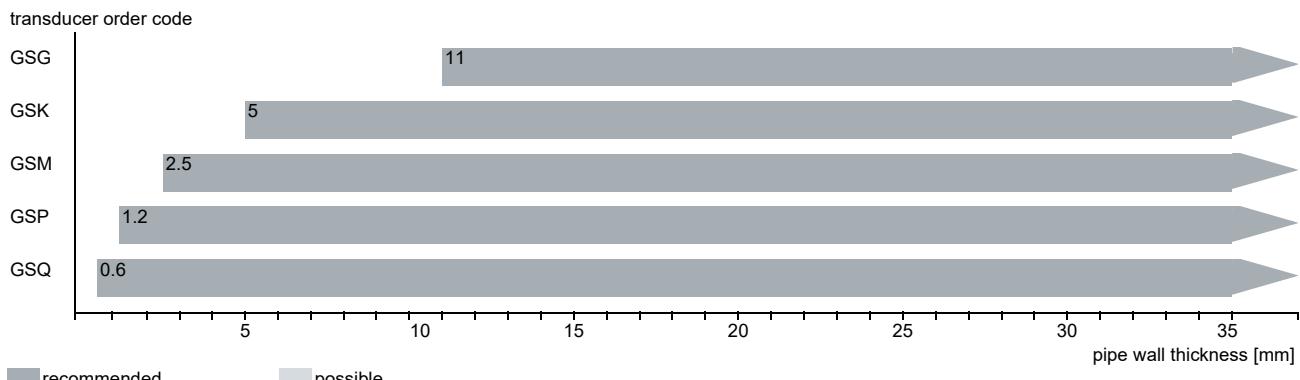

Step 1a

Select a Lamb wave transducer:

Step 1b

If the pipe wall thickness is not in the range of the Lamb wave transducers, select a shear wave transducer:

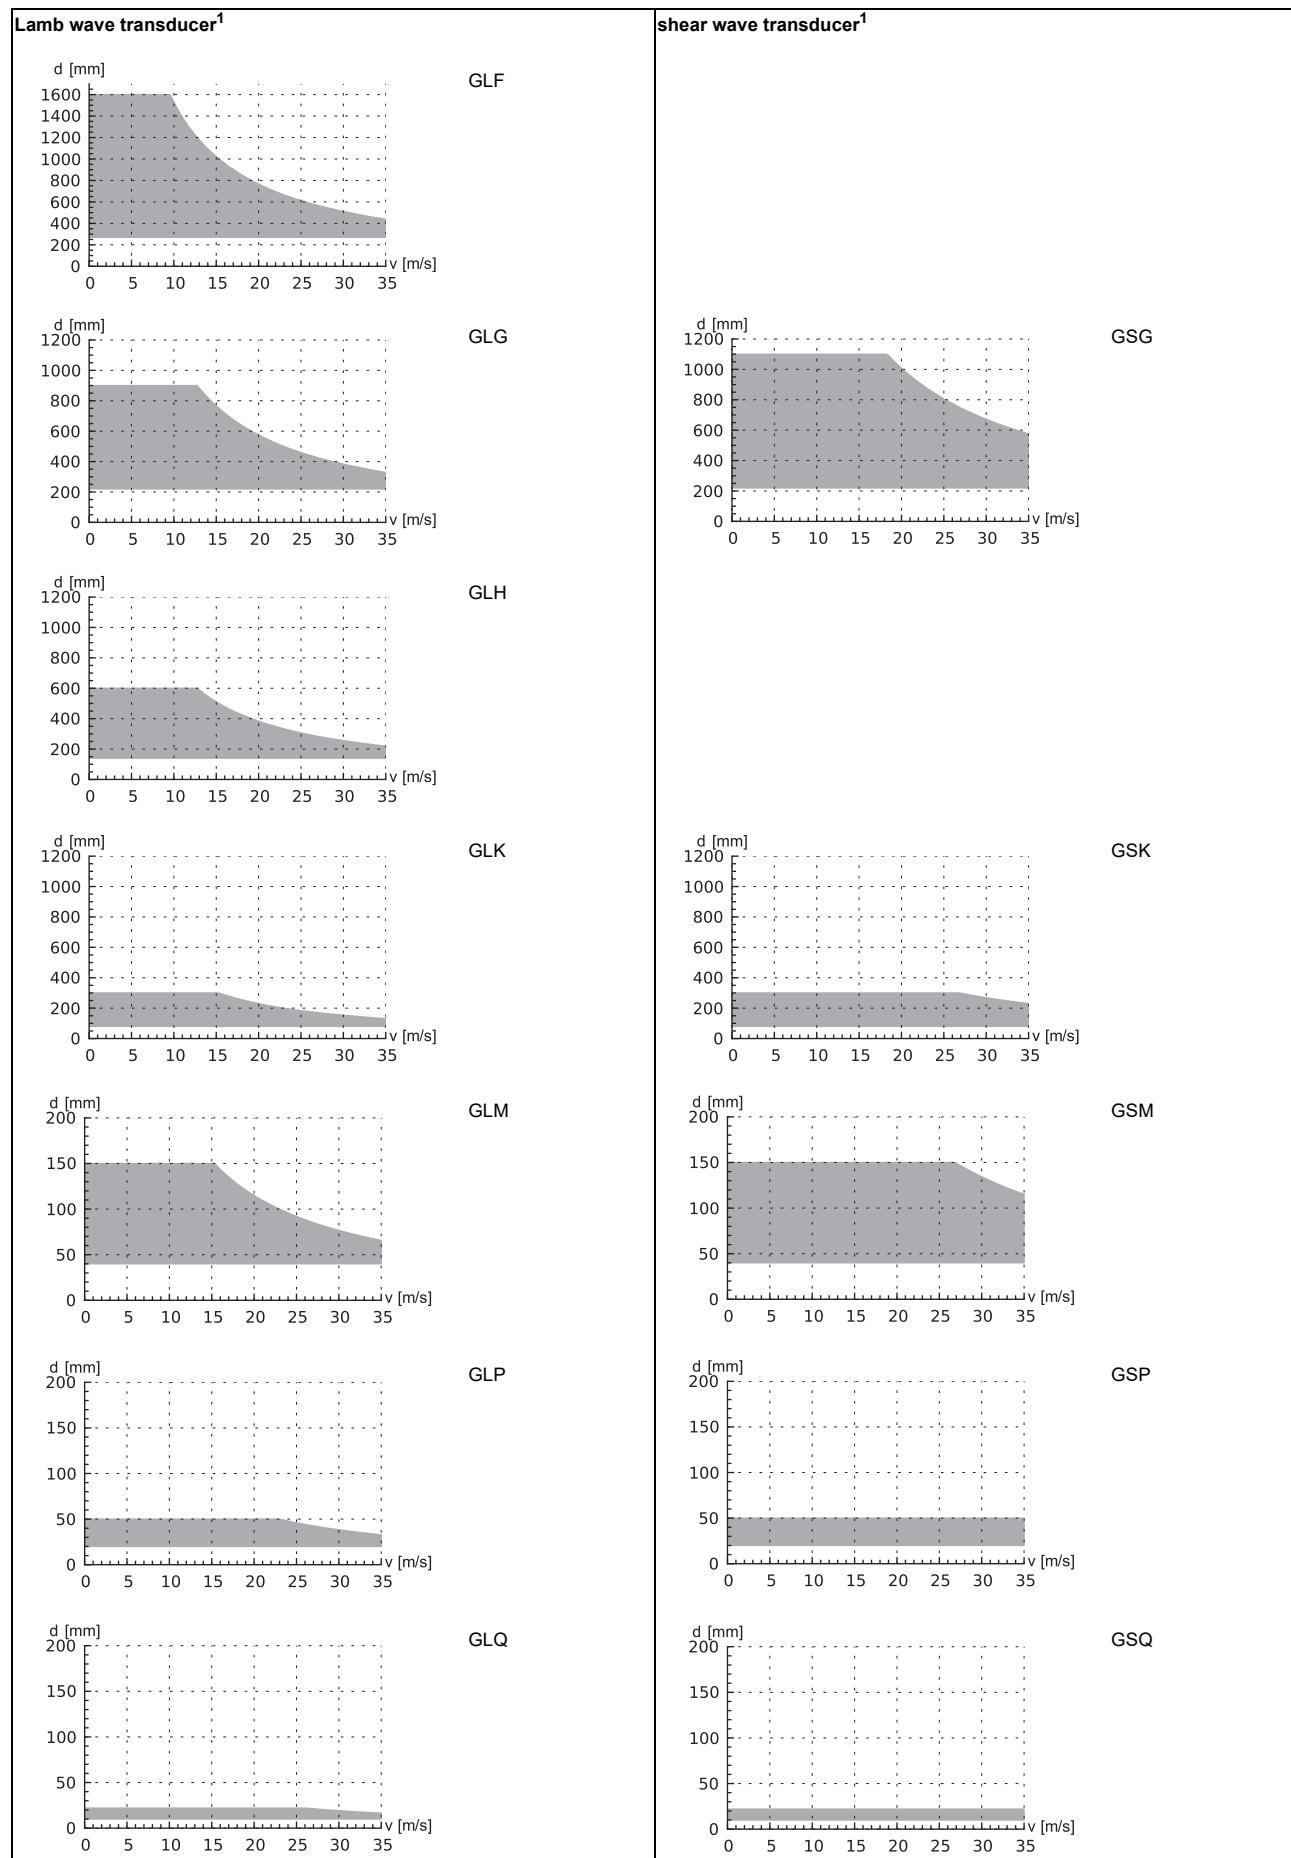

Step 2

inner pipe diameter d dependent on the flow velocity v of the fluid in the pipe

The transducers are selected from the characteristics (see next page). Lamb wave transducers are selected from the left column, shear wave transducers from the right column.

Lamb wave transducers: If the values d and v are not in the range, the diagonal arrangement with 1 sound path may be used, i.e. the same characteristics can be used with doubling the inner pipe diameter. If the values are still not in the range, shear waves transducers regarding the pipe wall thickness have to be selected in step 1b.

¹ inner pipe diameter and max. flow velocity for a typical application with natural gas, nitrogen, oxygen in reflection arrangement with 2 sound paths (Lamb wave transducers)/1 sound path (shear wave transducers)

Step 3

Damping material (optional)

Damping material will be used for the gas measurement to reduce acoustic noise influences on the measurement.

Damping mats

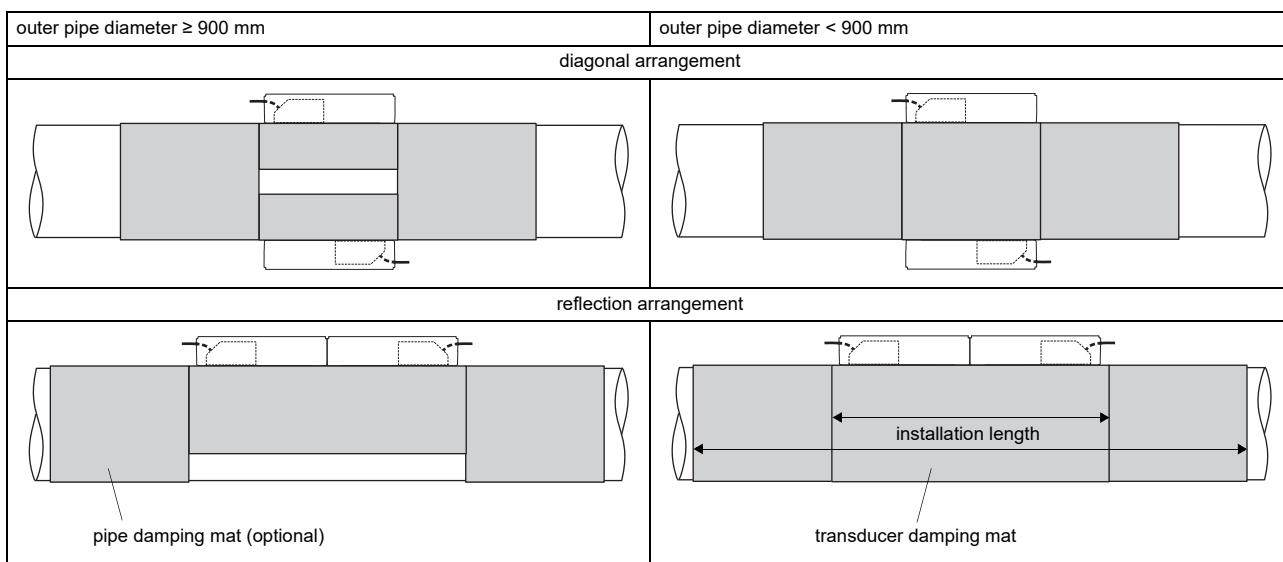

Damping mats will be used for the gas measurement to reduce acoustic noise influences on the measurement.

transducer damping mat

Transducer damping mats will be installed below the transducers.

pipe damping mat

Pipe damping mats will be installed if the sound propagation is disturbed at reflection points (e.g. flange, weld). Depending on the noise, the pipe damping mats will be installed at one or both sides of the transducer damping mat. If the local conditions are unknown, pipe damping mats should be installed.

¹ calculation on the base of:

max. installation length (installation of one transducer mounting fixture per transducer in reflection arrangement) and
max. recommended pipe diameter (standard) or max. extended pipe diameter (extended)

² calculation of the number of rolls when both transducers are mounted in one transducer mounting fixture (reflection arrangement) or in diagonal arrangement: number of rolls/2 and round up to the nearest integer

Damping coat

For high temperatures it is recommended to apply the damping coat onto the pipe.

type	Pt100	direct connection			
connection	4-wire				
measuring range °C	-50...+250				
accuracy T	±(0.15 °C + 2 · 10⁻³ · T [°C])				
	class A				
response time s	8				
	(t50, T1 = 25 °C, T2 = 60 °C)				
housing	PEEK, stainless steel 304 (1.4301), copper				
degree of protection	IP54				
dimensions					
length l	mm 14				
width b	mm 30				
height h	mm 27				
dimensional drawing					
weight	kg 0.32				
accessories					
thermal conductivity paste 200 °C	x				
thermal conductivity foil 250 °C	x				
plastic protection plate, insulation foam	x

Cable					
temperature probe		extension cable			
type		4 x 0.22 mm²			
standard length m		LIYCY 8 x 0.14 mm²			
max. length m		5/10/25			
ambient temperature °C		-50...+250			
min. bend radius mm		-25...+80			
mm 27		68			
cable jacket					
material		PFA			
outer diameter mm		4.8 ± 2			
colour		grey			

Fixation

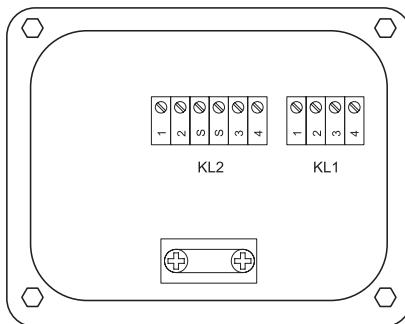

tension strap PT12N		material: stainless steel 301 (1.4310), 410 (1.4006) thermal insulation necessary
ball chain PT12F		material: stainless steel 316L (1.4404) length: 1 m

Junction box

JBT2, JBT3
